## Why control ticks?

Your home is your sanctuary. You want to be comfortable and safe inside and in your yard. Mosquitoes and ticks impact our quality of life. Not only do they harass us as we go about our outside activities, but they have the potential to sicken us and our pets, or even kill us with their pathogens.

### Ticks

**Ticks** are Mother Nature's ninjas. They can crawl up your body totally undetected. They will attach and drink your blood for days without you noticing. Unfortunately, while they are dining, they are also sharing chemicals and pathogens with you. These include Lyme disease, Bartonella, Babesia, Anaplasma, Tularemia and Rocky Mountain spotted fever. Your pets can also get some of these diseases.

The best way to avoid tick-borne diseases is to keep ticks from ever biting you. Seasonal applications of safe-to-humans pesticides are effective in reducing tick populations in your yard.

Our tick product is labeled to control many other insects, including **fleas**, ants, millipedes, centipedes, and many lawn pests. Our clients have reported seeing fewer mosquitoes after a tick treatment as well.

### Other tick services

We are trained to identify and assess your tick samples for your doctor to make an informed decision regarding treatment for Lyme disease, following a tick bite.

For a nominal fee, we will pick up your sample, identify it to species, life stage and engorgement level, and send your doctor a written report by fax.

For an additional fee, we will have the tick tested for Lyme disease, if the situation warrants.

We also conduct public seminars for your organization regarding tick- and other vector-borne diseases.

### Our Mission

Let us come to your property and assess your situation, free of charge. We are able to treat your yard with pet-friendly products, which will help to keep your family safe from disease-carrying ticks and mosquitoes.
